No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to methods for measuring the genomic replication of a virus that is dependent for replication upon RNA-dependent RNA polymerase (RDRP) virus comprising transfecting cells with a construct having, in antisense orientation, the cDNA of a reporter gene sequence operably linked on its 5' end with the untranslated region (UTR) of the native 3' end of the RDRP virus and operably linked on its 3' end with the UTR of the native 5' end of the RDRP virus. The methods are useful for designing therapies for the in vivo treatment of cells that are infected with RDRP viruses. The methods are also useful to provide a convenient platform for screening inhibitors to RDRP viral replication. The present sequence is that of part of the pMJ050 construct (ABQ78071) used in examples of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Measuring the genomic replication of RNA-dependent RNA polymerase (RDRP) virus, for designing therapies for the treatment of cells infected with RDRP viruses, by transfecting cultured cells with a construct comprising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim 12; Fig 3; 60pp; English

The invention relates to methods for measuring the genomic replication a virus that is dependent for replication upon RNA-dependent RNA polymerase (RDRP) virus comprising transfecting cells with a construct having, in antisense orientation, the cDNA of a reporter gene sequence operably linked on its 5' end with the untranslated region .(UTR) of the native 3' end of the RDRP virus and operably linked on its 3' end with the UTR of the native 5' end of the RDRP virus. The methods are useful
                                                                                                                                                                                                 Example 1; Fig 3; 60pp; English

                                                                                                                                                                                                                                                                                                                                               The invention relates to methods for measuring the genomic replication of a virus that is dependent for replication upon RNA-dependent RNA polymerase (RDRP) virus comprising transfecting cells with a construct having, in antisense orientation, the cDNA of a reporter gene sequence operably linked on its 5' end with the untranslated region (UTR) of the native 3' end of the RDRP virus and operably linked on its 3' end with the UTR of the native 5' end of the RDRP virus and operably linked on its 3' end with the UTR of the native 5' end of the RDRP virus. The methods are useful for designing therapies for the in vivo treatment of cells that are infected with RDRP viruses. The methods are useful to provide a convenient platform for screening inhibitors to RDRP viral replication. The present sequence is that of part of the pMJ050 construct (ABQ78071) used in examples of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Measuring the genomic replication of RNA-dependent RNA polymerase (RDRP) virus, for designing therapies for the treatment of cells infected with RDRP viruses, by transfecting cultured cells with a construct comprising

3'UTR
The invention relates to methods for measuring the genomic replication c a virus that is dependent for replication upon RNA-dependent RNA polymerase (RDRP) virus comprising transfecting cells with a construct having, in antisense orientation, the CDNA of a reporter gene sequence operably linked on its 5' end with the untranslated region (UTR) of the native 3' end of the RDRP virus and operably linked on its 3' end with the UTR of the native 5' end of the RDRP virus. The methods are useful for designing therapies for the in vivo treatment of cells that are
                                                                                                                                                       Measuring the genomic replication of RNA-dependent RNA polymerase (RDRP) virus, for designing therapies for the treatment of cells infected with RDRP viruses, by transfecting cultured cells with a construct comprising
                                                                                                                                                                                                                                   King
                                                                                                                                                                                                                                                                                                              31-JAN-2002; 2002WO-US002952

The methods are also useful to provide a convenient platform for screening inhibitors to RDRP viral replication. The present sequence is that of part of the pMJ050 construct (ABQ78071) used in examples of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The patent discloses methods for determining the p53 status of a sample CC which comprise providing a sample containing a pGL3 luciferase reporter CC vector and determining whether p53 binds to the pGL3 vector, p53 is a CC transcription factor that regulates many genes including those associated CC with cell cycle control, apoptosis and DNA damage repair, pGL3 reporter CC vectors contain a modified firefly luciferase cDNA designated luc+, p53 CC protein binds to pGL3-basic vector and causes luciferase expression. The CC method is useful for determining the p53 status of a sample. It is also CC useful for assaying for mimetics or antagonists of p53 and for assaying CC for presence of activated p53 and/or DNA damage. The invention also CC relates to a method of modifying pGL3 vector which involves deleting or CC altering a sequence within 20 bp sequence 5' or 3' of CCCGGG motif. The CC nucleic acid having a sequence incorporating the CCCGGG motif is useful CC conferring promoter activity or p53-responsiveness on a nucleic acid cc encoding a polypeptide of interest or in assays for p53 transcriptional activity. The present DNA sequence is pGL3 enhancer vector sequence
